

## **Gilpin County**

### **Mountain House District**

Gilpin is the second smallest county in Colorado but has the second highest gold production. Several months after the big discovery on Clear Creek, gold was discovered by John Gregory near Blackhawk in 1859. A few months later, the placers and veins in Russell Gulch initiated a major rush into this mountainous area. Early lode mining was restricted to oxidized ore, which normally reached 40- to 100-feet below the surface. The construction of the Hill smelter in Blackhawk in 1868 enabled extraction of metals from the unoxidized sulfide ores. Later, the completion of the railroad from Denver to Blackhawk spurred production again. Mining diminished early in the 20<sup>th</sup> century and has proceeded only sporadically since 1909.

The first discoveries in the area occurred in Gamble Gulch in 1859 (Koschmann and Bergendahl, 1968). Stamp mills processed the oxidized ore and the level mining activity followed the same pattern as in Clear Creek County. Much placer activity occurred in the various gulches, especially near Rollinsville. The geology is much the same as in Clear Creek County, with Precambrian bedrock of the Idaho Springs Formation cut by Boulder Creek Granite with Tertiary intrusions of quartz monzonite and bostonite porphyries. Fissure fillings include pyritic gold that, where unweathered, is rather low grade but has been enhanced by oxidation.

The Mountain House District is listed in Henderson (1926) and Dunn (2003). It is shown on a map in Marshall (1920) as being a large district in the northeast corner of the County. Not much is known about the District. Commodities included: zinc, silver, gold, cadmium, copper, and lead.

Mines listed in the district (mindat.org) include:

- Atlantic - No. 691 (silver)
- Babe of the Woods
- Dory Hill (pegmatite with niobium, mica, quartz, feldspar, and iron)
